

sureshotgps™

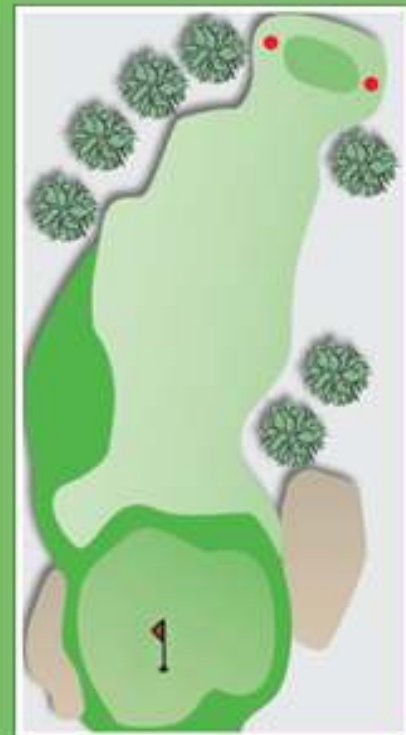

How far to the pin?

sureshotgps™ improves your golf by providing distances anywhere on the course. No more searching for distance markers means faster play. A player can record distances for each club; this data is then used in providing personal club selection.

sureshotgps™ device features:

- Handheld (optional clip provided for fixing to belt or golf buggy) Global Positioning System displays distances to the front, centre and back of the green from anywhere, Tee to Green.
- Ability to display up to 15 additional reference points which give distances to hazards, e.g. sand traps, water and dog-legs etc.
- Data for multiple golf courses (up to 10) can be stored – course data can be recorded by the player or downloaded by subscribing to the course database.
- Can be used on any golf course around the world (subject to local rules).
- Personal club recommendation can be given for each shot (when enabled).
- Statistical information for a round can be collected.
- Scores can be kept.
- Specific shots can be measured and recorded e.g. driver distance. Once the player has measured distances for each club the information is stored in the **sureshotgps™** and used to suggest a club selection (when enabled).
- Has a USB port which allows the unit to be recharged via an AC adaptor, (optional car charger is available) and also connects the **sureshotgps™** to a PC for uploading and downloading of course information & statistics.

The **suresanalysis™** software (a Windows™ based application) is included as a bonus with the **sureshotgps™**. This software is used to register the **sureshotgps™** and subscribe to the course database as well as analyse the statistical data recorded during a round.

suresanalysis™
software included
